• Formed in 1933 by an act of the California legislature to manage the OC groundwater basin and protect OC’s rights to the Santa Ana River water

• Basin provides groundwater to 19 municipal and special water districts that serve 2.4 million customers in north and central Orange County

• Basin currently supplies 75% of the water supply for north and central OC
CROSS SECTION OF THE GROUNDWATER BASIN
SOURCES OF WATER FOR GROUNDWATER BASIN

- Annual Recharge (afy)
- Year
- GWRS
- Imported Water
- Storm Flow Recharge
- Recharged Base Flow
- Incidental Recharge

Data for the years 1936 to 2014.
THE GROUNDWATER REPLENISHMENT SYSTEM (GWRS)

• New 100 million gallon per day (MGD) advanced water purification facility
• Takes sewer water that otherwise would be discharged to the ocean, purifies it to near distilled quality and then recharges it into the groundwater basin
• Provides a new 103,000 acre-feet per year (afy) source of water, which is enough water for nearly 850,000 people
• Operational since January 2008 (70 MGD) expanded May 2015 (30 MGD)
• Largest planned indirect potable reuse project in the world
MICROFILTRATION (MF) PROCESS

• 120 MGD Siemens CMF-S Microfiltration System
• In basin submersible system
• Tiny, straw like hollow fiber polypropylene membrane
• 0.2 micron pore size
• Recovery rate: 90%
• Removes bacteria, protozoa, and suspended solids
REVERSE OSMOSIS (RO) PROCESS

- 100 MGD Reverse Osmosis System
- 3 stage: 78-48-24 array
- Hydranautics ESPA-2, CSM RE8040-Fen and DOW XFRLE-400 Membranes
- Recovery rate: 85%
- Removes dissolved minerals, viruses, and organic compounds (incl. pharmaceuticals)
- Pressure range: 150 – 200 psi
ADVANCED OXIDATION PROCESS (AOP)

- 100 MGD Trojan UVPhox System
- Low Pressure – High Output lamp system
- Destroys trace organics
- Uses Hydrogen Peroxide to create an Advanced Oxidation Process
- After treatment, water is so pure (and aggressive) that minerals (lime) are added back into the water
REGULATORY OVERSIGHT

- Regional Water Quality Control Board issues permits for recycling
- Division of Drinking Water (DDW) regulates drinking water and establishes reclamation criteria
  - Treatment
  - TOC limit
  - Travel time
  - Blending
- No federal role regulating reuse
- DDW hearing findings and recommendations incorporated into permit by Regional Board
INDEPENDENT ADVISORY PANEL

- Appointed by National Water Research Institute
- Leading experts in hydrogeology, chemistry, toxicology, microbiology, engineering, public health, public communications and environmental protection
- Review operations, monitoring and water quality
- Panel makes recommendations to OCWD and regulatory agencies to assure quality and reliability
GWRS PROVEN RELIABILITY

- California Department of Public Health (now Division of Drinking Water) developed permit requirements
- Test for over 400 compounds with all results well below permit levels or at non-detection (ND) levels
  - 28 Volatile Organic Compounds – All ND
  - 39 Non-Volatile Synthetic Organic Compounds – All ND
  - 8 Disinfection By-Products – All ND
  - 10 Unregulated Chemicals – All but one ND, all below permit levels
  - 51 Priority Pollutants – All ND
  - 16 Endocrine Disrupting Chemicals and Pharmaceuticals – All ND
• Original Project Cost: $481 million
  • Split equally between OCWD and OCSD
• Expansion Project Cost: $142 million
• Costs comparable to imported water
  • Original Project received $92 million in state and federal grants, and $4 million per year (21 year) operation and maintenance subsidy from Metropolitan Water District
  • Expansion Project received $1 million in state grants
• Both projects used State Revolving Fund (SRF) loans
• Costs $480 per acre-ft ($850 per acre-ft without subsidies)
PUBLIC OUTREACH

• Many projects stopped by public and political opposition
• Outreach began early, more than 10 years prior to start-up
• Researched public concerns
• Face-to-face presentations
• Community leaders
• Measured effects of outreach
• Community support
• Outreach continues today, assisted by media interest
• No active opposition
BENEFITS OF GWRS

• Creates a new **local** water supply
• Reuses a wasted resource
• Increases water supply reliability
• Costs less than water from the Colorado River and the State Water Project
• Uses one-half the energy it takes to import water and one-third the energy to desalinate seawater
• Improves quality of water in the basin
KEYS TO SUCCESS

• Project meets Orange County’s water needs
• Board of Directors insistence on highest quality water
• History of successful water reuse in Orange County with Water Factory 21 recycling facility
• Groundwater basin provides environmental buffer and psychological barrier
• Successful outreach from conception of facility, to construction and finally commissioning
WHAT HAVE WE LEARNED FROM GWRS?

• Public can accept indirect potable reuse projects if:
  • Need is clear
  • Outreach is effective and ongoing
  • Elected officials and community leaders make commitment
  • Quality is higher than alternatives
  • Regulators have ongoing oversight
  • The more people know about GWRS the more they accept it
GWRS SUCCESS

From toilets to tap: How we get tap water from sewage

SINGAPORE — This tiny nation is aggressively promoting a solution to the water scarcity that many countries worldwide are facing today. In Singapore, efforts to recycle wastewater are well underway.

In the past, water from one country was not considered a feasible alternative to fresh water. But, as Singapore's population grew, the city faced a significant water shortage. To meet the challenge, the city implemented a comprehensive water recycling system. The approach involves treating wastewater to make it suitable for drinking and other uses.

The success of this initiative has earned Singapore international recognition, demonstrating how reuse and conservation can effectively address water scarcity. This approach not only conserves water resources but also reduces the environmental impact of water treatment and disposal.

The Wall Street Journal

Sewer to Spigot: Recycled Water

In an effort to replenish its groundwater supply, Los Angeles is slated to announce Thursday a plan that will recycle 4.9 billion gallons of treated wastewater to drinking standards by 2019. In San Diego, the city council voted in favor of a pilot project that would pump recycled sewage water into a drinking-water reservoir, despite a veto from the mayor over the system's cost. Miami-Dade County, Fla., is planning a system that would pump 23 million gallons a day of purified wastewater into the ground; the water will eventually travel to a supply well and be reclaimed for drinking use.

Water recycling is just one of a number of tools to parched cities—many of which have faced water shortages for years—are using. "Demand is growing, and supply is pretty much staying static," says Wade Miller, executive director of the Membrane Association, a Washington, D.C.-based group.
