

Integrating Onsite Water Reuse with Centralized Treatment Systems

December 19, 2019

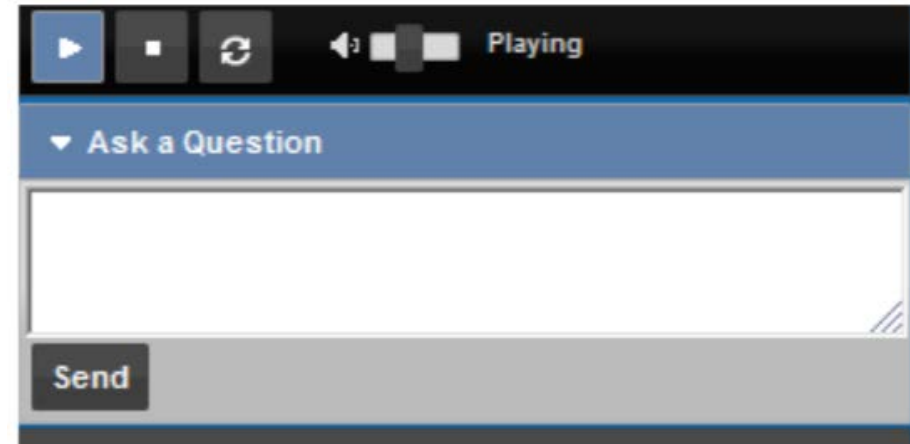

WaterReuse Webcast Series

© 2019 by the WaterReuse Association

A Few Notes Before We Start...

- Today's webcast will be 60 minutes.
- There is one (1) Professional Development Hour (PDH) available for this webcast.
- A PDF of today's presentation will be shared via email
- Please type questions for the presenters into the chat box located on the panel on the left side of your screen.

Today's Presenters

Moderator
Mary Ann Dickinson
President & CEO
Alliance for Water Efficiency

Presenter
Paula Kehoe
Director of Water Resources
San Francisco Public Utilities Commission

ADVANCING ONSITE WATER REUSE & LESSONS LEARNED

Onsite Water Reuse
Innovations Program

San Francisco knows the importance of diversifying our water portfolio...
To ensure reliability—particularly in the age of climate change—we need
to use every water resource available.

3.7M GPY Potable Offset

Turning waste water into steam

❶ About 30 million gallons of runoff water is collected annually under the Powell Street BART Station.

❷ The runoff water is pumped about a thousand feet to Energy Center San Francisco located at 460 Jessie St.

❸ The water is filtered, purified and boiled into steam.

❹ The steam is sent through pipes to heat about 180 buildings in the Financial District.

ONSITE WATER REUSE

SAN FRANCISCO'S LESSONS LEARNED

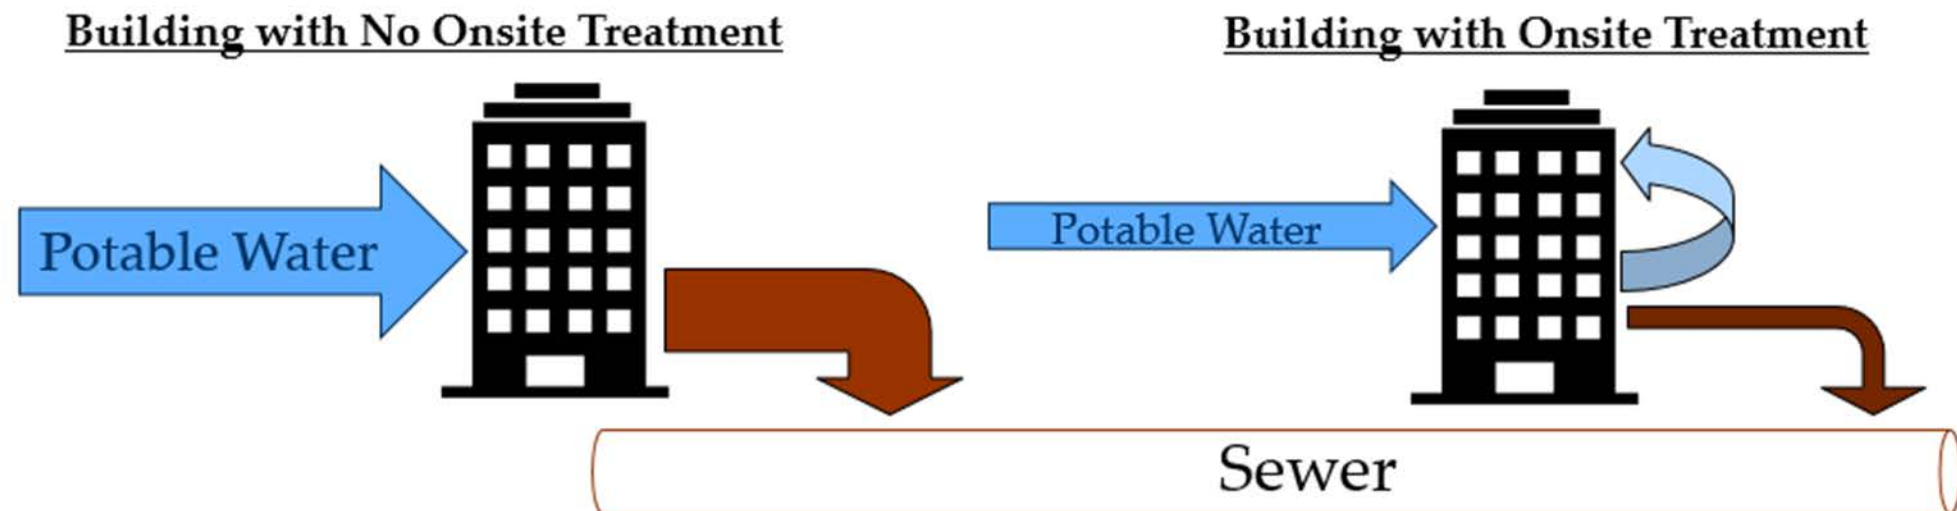

- Program Development
- Water Quality and Treatment Design
- Key Utility Considerations
- Operator Capacity
- Partner with Developers, Vendors and General Public
- Resource Recovery Opportunities

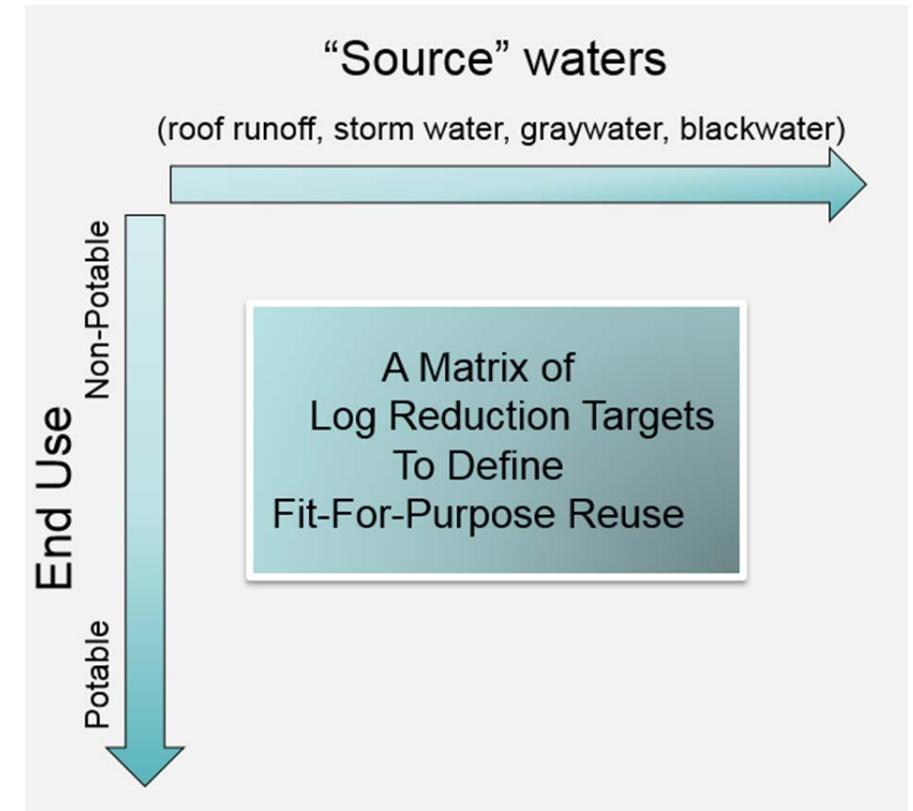

- Need for multi-agency collaboration
- Identify roles and responsibilities
- Establishment of rules and regulations
- Identify enforcement measures
- Policy synergies
- Cultural shift

- Require connections to municipal water and sewer systems
- Require backflow protection requirements
- Conduct cross-connection test prior to operation

- CA Plumbing Code limitations
- Protection of public health: risk-based water quality standards
- Design treatment systems to reduce pathogens that can impact public health (protozoa, bacteria, and virus)

Graywater and Blackwater Treatment

- Biological treatment of graywater and blackwater can reduce TSS, turbidity and BOD; improve UV Transmittance; and can reduce ammonia
- Raw graywater BOD can be as high as 600 mg/L
- Consider aesthetics desired for end uses, e.g. toilet flushing

Source: Aquacell

Rainwater Harvesting

- Routing rainwater through a green roof or planter can create issues with color and turbidity
- Tanks and pipes must be properly sealed to prevent mosquito growth
- Plumbing cistern to be able to flush with potable water helps avoid dry season stagnation

- Wastewater flows and odors
- Revenue impacts
- Capacity charge adjustments
- Excess use charges

Management and Mitigation Approach

- ✓ Hydraulic modeling used to evaluate impacts
- ✓ So far, no impacts expected in SF
- ✓ Alternative strategies available (e.g. flushing, trucking solids)

- Operators benefit from having experience with both traditional water and wastewater technologies
- Require operators to sign affidavit acknowledging they possess appropriate knowledge, skills, and training
- Early communication is key among operators, project owners, and engineers about ongoing O&M costs and responsibilities

NON-POTABLE WATER CALCULATOR
Step 6 of 7: Summary of Building Potential

Project Name: ABC Building

Legend:
 User Input: [Green Box]
 Taken from User Input: [Blue Box]
 Default Value: [Light Green Box]
 Supplemented Input: [Light Blue Box]

Instructions:
 An accounting of total demand and onsite supplies for the project are summarized below.
 No user input is needed for this step.

A. TOTAL DEMAND (No user input needed - auto-calculated)

Demand Type	Peak Daily Water Demand (gpd)	Annual Water Demand (gpy)	Average Monthly Demand (gpm)											
			January	February	March	April	May	June	July	August	September	October	November	December
DOMESTIC FEATURES - Commercial														
Showers	15	4,320	995	995	995	995	995	995	995	995	995	995	995	995

Pathogen Credits			
Treatment Process	MBR	UV	Chlorine
Virus	1.5	Up to 6	Up to 5
Protozoa	2	Up to 6	0
Bacteria	4	Up to 6	Up to 5
Ongoing Requirements	Operate within Tier 1 envelope	Online monitoring to confirm validated dose	Demonstrate CT with verified free chlorine residual

Onsite Water Reuse Lessons Learned

Share Learning with Developers and Vendors

- Encouraging blackwater reuse in commercial buildings as opposed to graywater can achieve significantly higher potable water savings

- Signage in bathrooms and common areas is an opportunity to engage occupants and visitors about conserving water with onsite water treatment systems

Wastewater Heat Recovery:

The extraction of thermal energy from warm wastewater, and subsequent beneficial use of this energy to offset building energy use for applications such as hot water heating or space heating/cooling

- Potential for heat recovery is greatest in multi-family residential buildings
- Maximizing benefits requires integration with building hot water and/or space heating & cooling systems
- Wastewater heat recovery has synergies with onsite reuse
 - ✓ Onsite water reuse systems will already have EQ tanks that can provide consistent flow to heat recovery system
 - ✓ Heat can be recovered from treated gray or blackwater, meaning less wear and tear on heat recovery equipment from raw wastewater
 - ✓ Heat recovery will cool down treated non-potable water, which can help control Legionella growth in distribution system

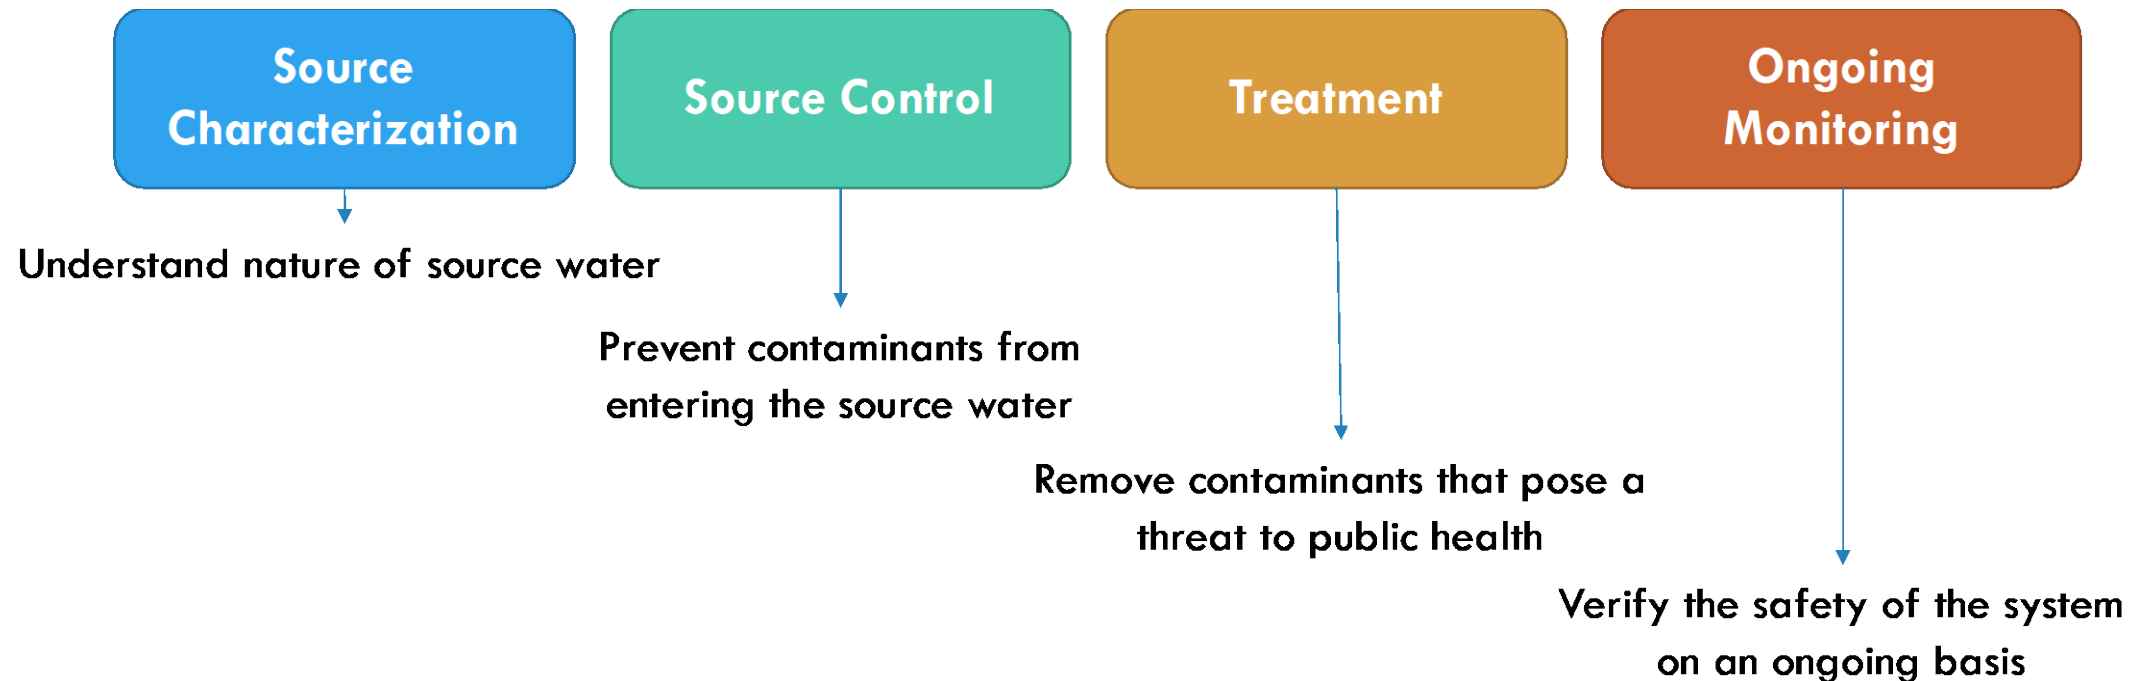

SAN FRANCISCO'S INNOVATIONS PROGRAM

Brewery Process Water Reuse

- Typical brewery can use 5 – 7 gallons of water to produce 1 gallon of beer
- Breweries can collect & treat process water onsite to reduce water footprint
 - Rinsing tanks, bottles, and kegs
 - Floor wash down
 - Cooling towers
 - Beer production
- SFPUC Onsite Water Reuse Grant Program contain guidance on brewery process water reuse

- San Francisco's chemical and pathogen control strategy is based on four key elements to ensure public health protection:

Building on our values

INNOVATION

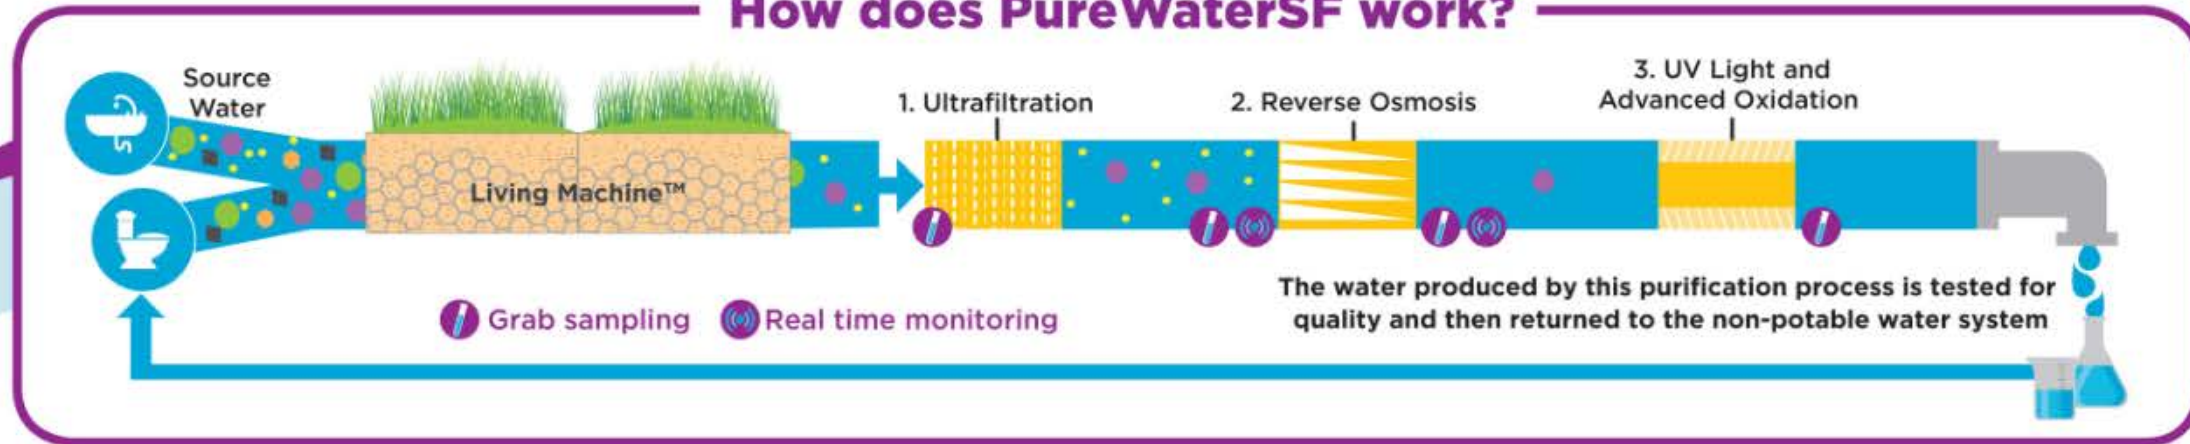

RESEARCH

EXPLORATION

How does PureWaterSF work?

Findings: Water Quality and Treatment Performance

✓ **>1,300 individual analyses performed**

✓ **Pharmaceuticals & other CECs are removed well through treatment train**

✓ **Chemicals are below regulatory limits in finished water**

Detected Below MCL, 6

✓ **Treatment processes achieved pathogen removal goals**

Atmospheric Water Generation *Additional Opportunity to Produce Water Onsite*

**National Blue Ribbon
Commission
for Onsite Non-potable
Water Systems**

Varying Water Quality Standards Across the US

Graywater Use to Flush Toilets						
	BOD ₅ (mg L ⁻¹)	TSS (mg L ⁻¹)	Turbidity (NTU)	Total Coliform (cfu/ 100ml)	<i>E. Coli</i> (cfu/ 100ml)	Disinfection
California	10	10	2	2.2	2.2	0.5 – 2.5 mg/L residual chlorine
New Mexico	30	30	-	-	200	-
Oregon	10	10	-	-	2.2	-
Georgia	-	-	10	500	100	-
Texas	-	-	-	-	20	-
Massachusetts	10	5	2	-	14	-
Wisconsin	200	5	-	-	-	0.1 – 4 mg L ⁻¹ residual chlorine
Colorado	10	10	2	-	2.2	0.5 – 2.5 mg/L residual chlorine
Typical Graywater	80 - 380	54 -280	28-1340	10 ^{7.2} – 10 ^{8.8}	10 ^{5.4} – 10 ^{7.2}	N/A

Developed a risk-based water quality approach for onsite non-potable water systems

Pathogen Log Reduction Targets (LRTs)

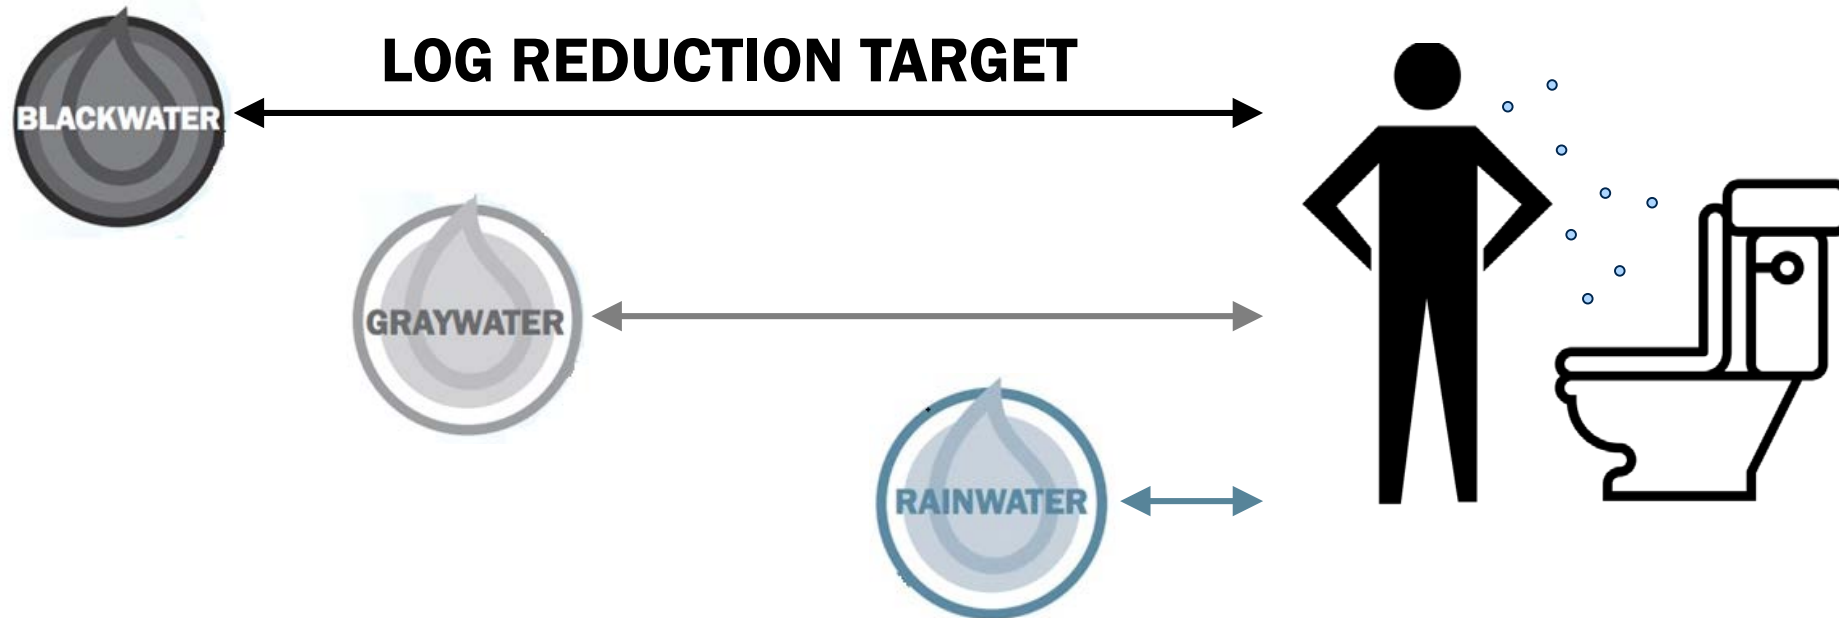

Continuous online monitoring

Treated water quality standards

Pathogen Log Reduction Targets

Source waters have different starting pathogen concentrations

Target safe pathogen level is the same regardless of source water

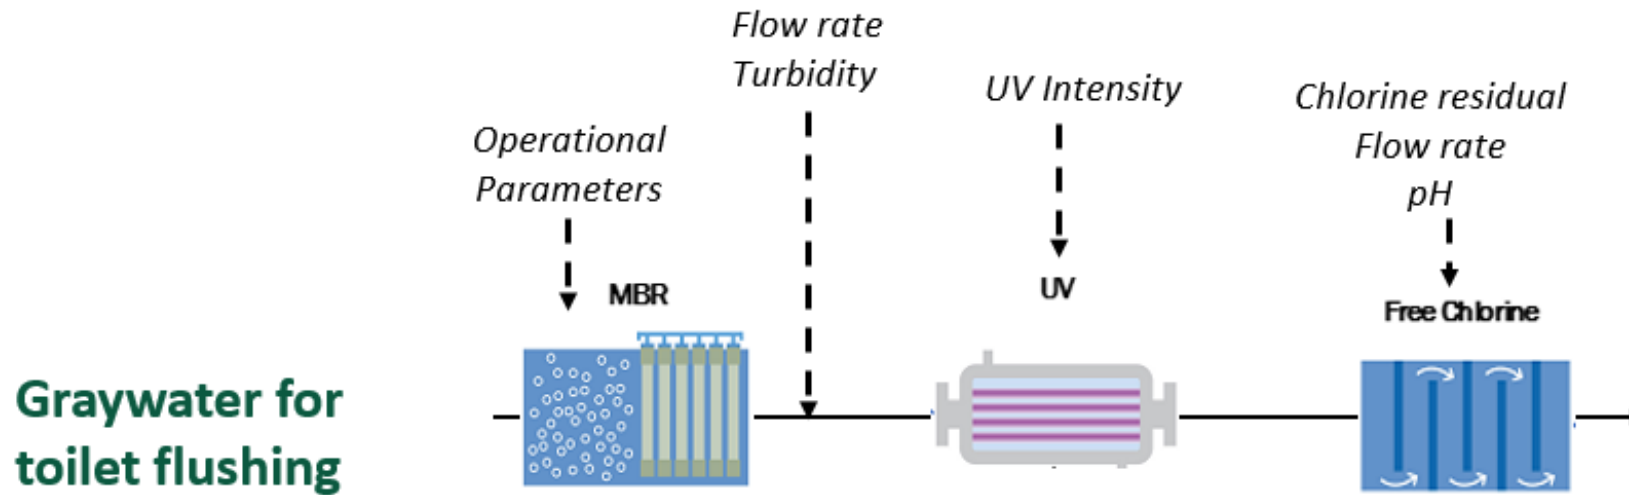

Log reduction target is the difference between the starting point and the safe end point

Pathogen Log Reduction Targets for Various Water Sources & End Uses

	Enteric Viruses	Parasitic Protozoa	Enteric Bacteria
Blackwater			
Outdoor use	8.0	7.0	6.0
Indoor use	8.5	7.0	6.0
Graywater			
Outdoor use	5.5	4.5	3.5
Indoor use	6.0	4.5	3.5
Roof Runoff			
Outdoor use	N/A	N/A	3.5
Indoor use	N/A	N/A	3.5
Stormwater			
Outdoor use	3.0	2.5	2.0
Indoor use	3.5	3.5	3.0

Example Graywater System Treatment Train

Pathogen Credits			
Treatment Process	MBR	UV	Chlorine
Virus	1.5	Up to 6	Up to 5
Protozoa	2	Up to 6	0
Bacteria	4	Up to 6	Up to 5
Ongoing Requirements	Operate within Tier 1 envelope	Online monitoring to confirm validated dose	Demonstrate CT with verified free chlorine residual

Model Regulations for Consistency Across the US

- San Francisco
- Colorado, Regulation #84
- California SB 966 and Hawaii HB 444
- Minnesota and Washington D.C. Guidelines for Stormwater
- Washington State and Oregon
- Texas and Alaska

- Stretch drinking water supplies
- Assist with stormwater management
- Defer capital investment in large centralized infrastructure
- Potential for lower energy footprint

Tools for Developing Local Oversight and Management Programs

BLUEPRINT for Onsite Water Systems

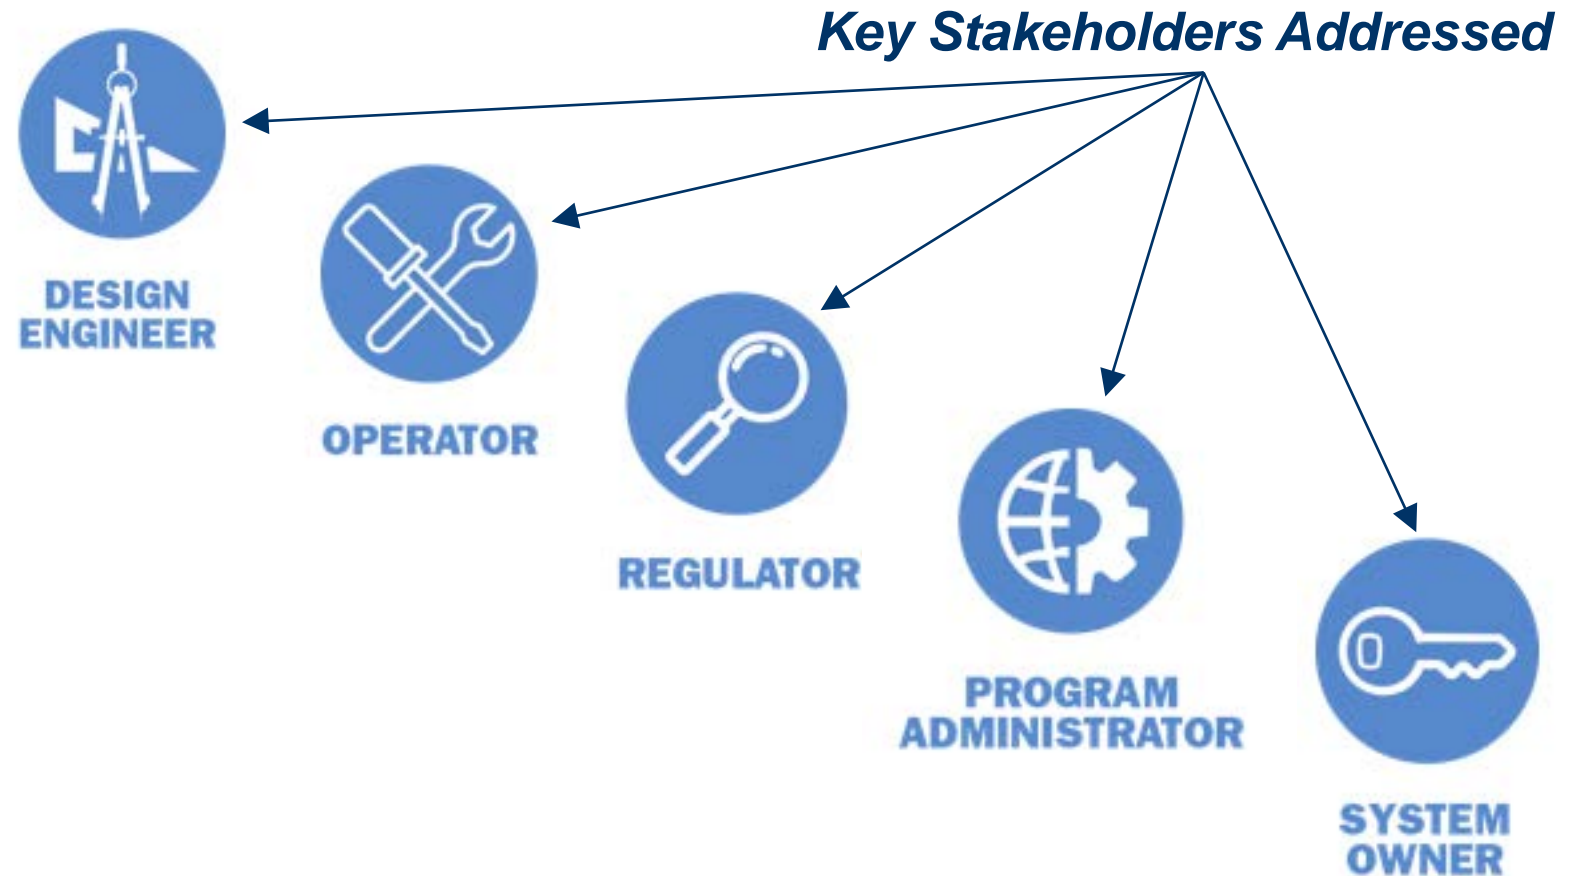

A Step-by-Step Guide for Developing a Local Program to Manage Onsite Water Systems

Developing a local program to manage onsite water systems offers a proactive way to increase water resiliency and promote green building practices while protecting public health. The development of a program should follow a sequence of steps and associated actions, which will inform critical decisions regarding the scope, structure, and implementation of the program.

- 1 **Convene a Working Group**
Establish a small working group to guide the development of the local program.
- 2 **Select the Types of Alternate Water Sources**
Narrow the specific types of alternate water sources covered in the program.
- 3 **Identify End Uses**
Classify specific non-potable end uses for your program.
- 4 **Establish Water Quality Standards**
Establish water quality standards for each alternate water source and/or end use.
- 5 **Identify and Supplement Local Building Practices**
Integrate your program into local construction requirements and building permit processes.
- 6 **Establish Monitoring and Reporting Requirements**
Establish water quality monitoring and reporting requirements for ongoing operations.
- 7 **Prepare an Operating Permit Process**
Establish the permit process for initial and ongoing operations for onsite water systems.
- 8 **Implement Guidelines and the Program**
Publicize the program to provide clear direction for project sponsors and developers.
- 9 **Evaluate the Program**
Promote best practices for onsite water systems.
- 10 **Grow the Program**
Explore opportunities to expand and encourage onsite water systems.

ANTICIPATED RELEASE EARLY 2020

CLEAR DESCRIPTION
OF CRITICAL TOPICS

- ✓ Risk-Based Water Quality Standards
- ✓ Basis for Log Reduction Targets
- ✓ Pathogen Crediting Frameworks

	Enteric Viruses	Parasitic Protozoa	Enteric Bacteria
Blackwater			
Outdoor use	8.0	7.0	6.0
Indoor use	8.5	7.0	6.0
Graywater			
Outdoor use	5.5	4.5	3.5
Indoor use	6.0	4.5	3.5
Roof Runoff			
Outdoor use	N/A	N/A	3.5
Indoor use	N/A	N/A	3.5
Stormwater			
Outdoor use	3.0	2.5	2.0
Indoor use	3.5	3.5	3.0

- Overview and detailed discussion of pathogen crediting
- Existing crediting frameworks to streamline implementation
- Online monitoring

EXAMPLE TREATMENT TRAINS

Blackwater Treatment Train

	Unit Process Pathogen Credits			Total Log Removal	LRTs for Blackwater
	MBR	UV	Free Chlorine		
Virus	1.5	3.5	5.0	10.0	8.5
Protozoa	2.0	6.0	0.0	8.0	7.0
Bacteria	4.0	3.5	5.0	12.5	6.0

STAKEHOLDER-SPECIFIC TIPS AND KEY MESSAGES

**DESIGN
ENGINEER**

The **Design Engineer** should evaluate source water quality to determine the size, or combination of sizes, of pretreatment screen to select.

**SYSTEM
OWNER**

Successful implementation of the Operations Plan will require that that necessary resources—personnel, training, funds, information, infrastructure—are available.

COMMISSIONING AND OPERATIONS GUIDANCE

Example Commissioning Plan Checklist

Commissioning Test Plan Checklist

- Set up system to ensure all treatment processes receiving pathogen credit can be sampled
- Ensure treated water can be discharged safely, e.g. to sewer
- Ensure adequate chemicals and consumables are available
- Notify relevant agencies about test plan and schedule
- Verify system controls are effective for ensuring LRT compliance, for example:
 - Low UVT alarm*
 - Low chlorine residual alarm*
 - High turbidity alarm*
 - Other critical LRT compliance alarms*
- Provide results to relevant agencies

Types of System Alarms

LRT Compliance Alarm

Indicates a problem with a unit process's ability to achieve the credited LRT

Water Quality Alarm

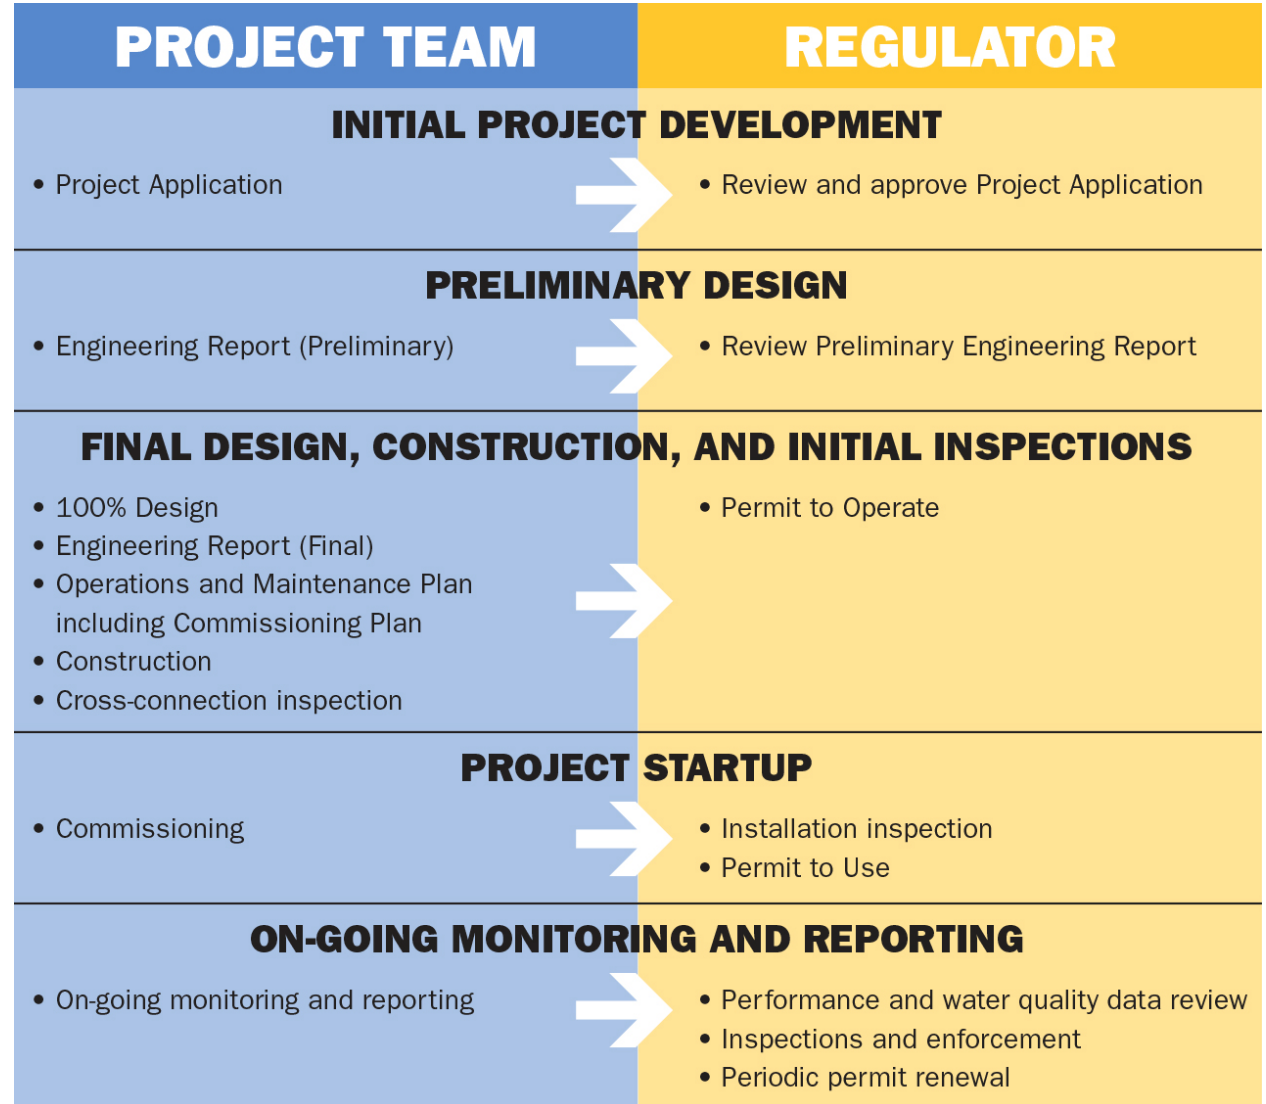

Indicates a problem with unit process or overall treatment train's ability to achieve a water quality target

Operational Alarm

Indicates a problem with a unit process or the overall treatment train's ability to function as designed and continue to produce water

PROGRAM IMPLEMENTATION AND REGULATORY GUIDANCE

- Expand risk-based framework to address new sources (e.g. condensate) and end uses (e.g. cooling tower make-up)
- Develop onsite water system operator certificate/certification program
- Develop bacterial log removal crediting frameworks for commonly used treatment processes in onsite water systems
- Define pathogen log removal credits for natural treatment systems (e.g. wetland treatment systems)

Collaboration Leads to New Opportunities

- Consensus among public health regulators and utilities to move towards risk-based approach
- EPA Water Reuse Action Plan highlights fit-for-purpose and national framework for risk-based targets
- Consistent standards nationwide increases market demand and can lead to more cost effective and energy efficient technologies with reduced footprint
- Future activities: pursue funding for research priorities, plumbing codes, NSF, US Green Building Council to align with address risk-based approach
